                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to peptides which act as antaqonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FF) and for treating a activity in the presence of a tissue factor (FF) and for treating a TF/FVIIa mediated disease or disorder. In a host. Diseases which can be treated include chronic thrombombolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hyperditary angioedemia, adult respiratory distress syndrome (ARDS), dissembnated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides or prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       inflammation; septic shock;
                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antagonist; factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromboelic disease; fibrin formation, vascular disorder; deep vein thrombosis; arterial thrombosis; syrÓke; metastasis; thrombolysis; arteriosclercsis; restenosis inflammation; septic shot septicaemia; hypotension; angloedema; ARDS.
New factor VIIa antagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FV/Ia mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New factor VIIa antagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation
                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                       Length 13;
                         processes and blocks initial events of blood coagulation

This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thromobembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to peptides which act as antagonist of Factor VIIa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antagonist; factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromobembolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thromobesis; strpke; metastasis; thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock; septicaemia; hypotension; angloedema; ARDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (FVINA). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TF) and for treating a FFF/IIA mediated disease or disorder in a host. Diseases which can be treated include chronic thromobembolic diseases or disorders associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New factor V/Ia antagonist peptide for research, diagnostic, therapeutic/and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The antagonist peptides

```
ö
with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) are also useful in research, and for diagnostic, therapeutic and antagonist peptides prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (FVIIa). FYIIa is a trypsin-like serine protease blood coagulation factor. FYIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TF) and for treating a activity in the presence of a tissue factor (TF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thrombosine diseases or disorders sasociated with fibrin formation including vascular disorders such as deep venous with fibrin formation including vascular disorders such as deep venous arteriosclerosis and restenosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to peptides which act as antagonist of Factor VIIa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inflammation; septic shock;
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antagonist; factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromobembolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis; thrombolysis; arterialscherosis; restenosis; inflammation; septic shocsepticaemia; hypotension; angloedema; ARDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New factor VIIa apkagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation
                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                 Length 16;

(FVIIA). FVIIA is a trypsin-like serine protease blood coagulation factor. FVIIA antagonist peptides are useful for inhibiting FVIIA activity in the presence of a tissue factor (TF) and for treating a crivity in the presence of a tissue factor. (TF) and for treating a TF/FVIIA meglated disease or disorder. Diseases which can be treated include chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to peptides which act as antagonist of Factor VIIa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock; septicaemia; hypotension; angioedema; ARDS.
and other diseases like inflammatory disorders. The antagonist peptic are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    factor VIIa; FVIIa; blood coagulation factor; inhibitor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chronic thromobembolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FF) and for treating a crivity in the presence of a tissue factor (FF) and for treating a crivity in the presence of a tissue factor (FF) and for treating a crivity in the presence of disorder in a host. Diseases which can be treated include chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angiocedem, adult respiratory distress syndrome (ARDS), disseminated intravacular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.

This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TF) and for treating a crivity in the presence of a tissue factor (TF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angiocedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New factor VIIa antagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin/like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (IF) and for treating a activity in the presence of a tissue factor (IF) and for treating a crivity in the presence of a tissue factor (IF) and for treating a crivity in the presence of a tissue factor (IF) and for treating a crivity in the presence of a tissue factor (IF) and for treating a crivity in the presence of a tissue factor (IF) and for treating a crivity in the presence of a tissue factor (IF) and for tissue associated with fibrin formation including vascular disorders such as finlammation, stroke, tumour metastasis, thrombolysis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, andications such as finlammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases/like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophlactic purposes. The present sequence represents a factor VIIa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

(FVIIa). FVIIa is a tryps in like serine procease blood coagulation factor. FVIIa antegonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FT) and for treating a crivity in the presence of a tissue factor (FT) and for treating a treated include chronic thrombombolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as laftlammation, septic shock, septicaemia, hypotension, cardipoulmonary bypags surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to peptides which act as antagonist of Factor VIIa
                                                                 Antagonist; factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromobembolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis; thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock; septicaemia; hypotension; angloedema; ARDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antagonist; factor VIIa; FVIIa; blood coagulation factor; inhibitor; chromobombolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis; thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock;

This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FF) and for treating a activity in the presence of a tissue factor (FF) and for treating a FFFVIIA mediated disease or disorder. In a host. Diseases which can be treated include chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arterial thrombosis, following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angiocema, adult respiratory discreases syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antagonist, factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromboembolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis; thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock; septicaemia; hypotension; angloedema; ARDS.
                                                                                                                                                                                                                                                                                                             New factor VIIa antagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 89; DB 22; Length 24; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to peptides which act as antagonist of Factor VIIa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FVIII). FVIII is a trypsin-like serine protease blood coagulation activity in the presence of a tissue factor (FF) and for treating a TF/FVIII mediated disease of a tissue factor (FF) and for treating a FF/FVIII mediated disease or disorder. In a host. Diseases which can be treated include chronic thromboelic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammation diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antagonist, factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromobembolic disease; fibrin formation; vascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis; thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock; septicaemia; hypotension; angloedema; ARDS.

This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FF) and for treating a activity in the presence of a tissue factor (FF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be treated include chronic thromobembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antagonist; factor VIIa; FVIIa; blood coagulation factor; inhibitor; chronic thromobembollre disease; fibrin formation; wascular disorder; deep vein thrombosis; arterial thrombosis; stroke; metastasis; thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock;
                 New factor VIIa antagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New factor VIIa antagonist peptide for research, diagnostic, therapeutic and prophylactic methods, inhibits FVII/FVIIa mediated processes and blocks initial events of blood coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 87; DB 22; Length 24, Pred. No. 1.6e-05;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Factor VIIa (FVIIa) antagonist peptide SEQ ID 44.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    septicaemia; hypotension; angioedema; ARDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ
                                                                                                                                                                                                                                                                                        This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (TF) and for treating a crivity in the presence of a tissue factor (TF) and for treating a TF/FVIIa mediated disease or disorder. In a host. Diseases which can be treated include chronic thrombombolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioceema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

treated include chronic thromobembolic diseases or disorders associated

```
This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FF) and for treating a crivity in the presence of a tissue factor (FF) and for treating a represence of discorder in a host. Diseases which can be treated include chronic thromboembolic diseases or disorders associated with fibrin formation including vascular disorders such as deep venous thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotenosic cardiopulmonary bypass surgery, hereditary angioceema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa antagonist peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              thrombolysis; arteriosclerosis; restenosis; inflammation; septic shock; septicaemia; hypotension; angloedema; ARDS.

```

This invention relates to peptides which act as antagonist of Factor VIIa (FVIIa). FVIIa is a trypsin-like serine protease blood coagulation factor. FVIIa antagonist peptides are useful for inhibiting FVIIa activity in the presence of a tissue factor (FF) and for treating a TF/FVIIa mediated disease or disorder in a host. Diseases which can be

                                     thrombosis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arterial thrombosis, stroke, tumour metastasis, thrombolysis, arteriosclerosis and restenosis following angioplasty, acute and chronic indications such as inflammation, septic shock, septicaemia, hypotension, cardiopulmonary bypass surgery, hereditary angioedema, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulapathy (DIC) and other diseases like inflammatory disorders. The antagonist peptides are also useful in research, and for diagnostic, therapeutic and prophylactic purposes. The present sequence represents a factor VIIa
